

**Information Report**  
**on Position A2.2.2 Introduction of daily and time-based water distribution**  
**in 10'000 hectares of WUAs**

The IWRM-FV Project Consultants Messrs. A.A. Alimdjanov and Sh.Kh. Yakubov were on a mission in the Fergana and Andijan provinces of the Republic of Uzbekistan from 13 to 22 July.

In the WUAs along SFMC daily planning of water distribution based on the method developed by SIC ICWC is being implemented. A water distribution corner is arranged in every WUA, where all the information on water use is to be available. During the mission, the WUA Consultants checked the accuracy of the execution and timeliness of water application execution by water users, registration of the applications, and operational adjustment of daily water distribution schedules in WUA canals proceeding from the volume of water discharge form the Andijan reservoir.

When accepting water application from water users and setting the priority of water supply among water users by a WUA canal, a special attention was paid to the systematization of the applications according to the irrigation contours of farms and WUA canals.

Steady operation of the WUA depends chiefly on its financial viability; therefore, analysis of the information of the WUA farms' accounts receivable and accounts payable was on the Consultants' radar.

Local specialists prepare a copy of the district's irrigated area map on a scale of 1:25000 with the plotting irrigation and collector-drainage networks on it, along with the identification of WUA boundaries after hydrographization.
